## Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application.

Listing of Claims:

10-13. (canceled)

14. (currently amended) A handheld audio device comprising:

a housing, said housing holding:

a controller:

at least one memory storing a control program for operating the handheld audio device, said at least one memory coupled to the controller:

an audio system coupled to the controller:

an ambulation system comprising:

an electromechanical ambulation mechanism having a foot for making contact with an external surface on which the handheld audio device is placed:

a first drive circuit coupled to the electromechanical ambulation

mechanism, and coupled to the controller;

wherein, the controller is programmed to drive the ambulation system in response to audio processed by the audio system.

 (original) The handheld audio device according to claim 14, wherein: said audio system comprises a loudspeaker, and a second drive circuit coupled to the loudspeaker.

- 16. (original) The handheld audio device according to claim 14 wherein:
- the controller is programmed to digitally process digital audio to obtain processed audio and drive the ambulation system according to the processed audio.
- 17. (original) The handheld audio device according to claim 16 wherein:

the controller is programmed to process digital music with a beat detection algorithm, in order to detect one or more beats, and operate the ambulation system so as to change a movement of the handheld audio device in response to the one or more beats.

- 18. (original) The handheld audio device according to claim 14 wherein:
  - said audio system comprises a microphone; and

wherein the controller is programmed by the control program to:

- process input audio signals received from the microphone to obtain processed audio: and
- operate the electromechanical ambulation mechanism according to the processed audio.
- 19. (original) The handheld audio device according to claim 18 wherein:

the controller is programmed to process input audio signals received from the microphone with a beat detection algorithm to detect one or more beats and operate the electromechanical ambulation mechanism to change a movement of the handheld audio device in response to the one or more beats.
